

# Project

---

Brings Project capability for the particular context.

## How to use it?

Example of use:

```
sh "Project/open.sh" code "$PROJECT_PATH"
```

This example will open project at `$PROJECT_PATH` using the Visual Studio Code program. If pre-open script is available, it will be executed, Pre-open script is expected to be at:

`Recipes/Project/project_pre_open.sh`

## Example of integration

The [HelixTrack project](#) incorporates the Project [Software-Toolkit](#) module. See the [open](#) script for the reference and follow the implementation.

## Features supported

- Project open script (with program and project root directory parameters provided)
- Project open recipes (pre-open script).

## Dependency

Script depends on [Software-Toolkit's](#) `get_progam.sh` [script](#) and it expects to have it present in the hierarchy.
